Timah

Timah tracks the time you spend on different activities. You can create timers with different names and simply press pause and play to record the time.

Say for instance you want to monitor how much you work, and how much time you spend on your classes at university. Then you can create a timer for each of those activities you want to monitor

Installation

```
git clone https://github.com/iaquobe/timah
cd timah
cargo install --path .
```

Usage

Timah has 3 modes:

- Nomal: here you can start/stop the timer
- Rename: renames the current timer
- Open: shows list of saved timers you can choose to use

Normal

`<space>`: starts/pauses timer: saves timestamps o: open list of timers n: rename the current timer q: quit the program

Rename

`<enter>`: confirm new name `<esc>`: cancel new name

Open

`<enter>`: confirm timer j/k: down/up q/`<esc>`: cancel open

TODO:

- readme with docs and gifs
- timer toggleable between showing slice or total
- timer reset
- legend showing keybindings
